I reviewed the React file and the project context document. The core idea is strong: the tracker has the beginnings of an editorial product, not just a database. But the current version has a serious issue: **the UI and narrative confidence are ahead of the evidence discipline**. If this is meant to become a respected industry resource, the biggest upgrade is not more deals — it is stronger verification, taxonomy, and analytical depth.

I'll separate this into the three areas you asked for.

---

1. Content & Analysis Quality

Executive view

The tracker currently feels like a **well-written AI enthusiasm map**, not yet an intelligence product.

The biggest risks:

1. **Several claims are written too definitively**
   - "first outright acquisition by big pharma"
   - "most powerful AI supercomputer"
   - "full enterprise deployment, not a pilot"
   - "AI-designed drugs"

   These are the kinds of statements that will get challenged by pharma BD people.
2. **Deal value and company descriptions mix different things**
   - Funding rounds ≠ pharma deal value
   - Platform adoption ≠ commercial partnership
   - Collaboration value ≠ guaranteed economics
3. **The "Why This Deal Matters" sections are directionally good but too often explain why AI is exciting rather than why this specific deal changes pharma strategy.**

Deal accuracy review

I checked the claims against available public announcements where possible.

1. Sanofi × Earendil Labs — mostly strong

The deal value is accurate:

- Up to $2.56B
- $160M upfront/near-term payments

- AI-driven discovery of bispecific antibodies in autoimmune/inflammatory disease

Cooley +1

Weakness:

The copy says:

> “Two deals totalling over $4B signal deep conviction in the platform.”

This is a little too investor-like.

A pharma person would ask:

- How much is milestone value?
- Are there clinical candidates?
- Is the platform differentiated from antibody engineering platforms generally?

Better framing:

> “The significance is not the headline value; it is Sanofi repeatedly choosing an external AI-native discovery platform as a source of biologics candidates rather than treating AI as an internal productivity tool.”

That is a much sharper thesis.

---

2. Eli Lilly × Isomorphic Labs

Mostly accurate.

The important point is actually the business model.

Your current analysis:

> “They don't license software. They sit alongside pharma R&D teams.”

Good.

But missing:

This is a shift from AI tooling → AI-native drug creation companies.

The interesting strategic question:

> Does pharma eventually buy molecules from AI-native biotech companies rather than build internal AI capabilities?

That is the insight.

The $2.1B number appears to refer to Isomorphic's funding round, not Lilly's deal economics. Reut…

I would separate:

- Company financing
- Pharma partnership value

---

3. Cradle

Good inclusion.

But the category is incomplete.

You put:

> Drug Discovery

I would add:

- Manufacturing & Supply Chain

Why?

Protein engineering is not only about finding molecules. It affects:

- expression
- stability
- manufacturability
- developability

The strategic angle:

> AI is moving upstream into molecule design, but the winners may be the platforms that optimise molecules for the factory, not just the molecule.

---

4. GSK × NOETIK

Good deal selection.

Your analysis is one of the better ones.

The strongest insight:

> “exactly where Phase 2 failure happens most”

That is the right direction.

However, be careful:

AI biomarker discovery does not automatically equal reducing Phase 2 failure.

More precise:

> “AI could improve patient stratification and biomarker selection — two major contributors to trial efficiency.”

---

5. Lilly × Tamarind Bio

Interesting, but the framing is too infrastructure-heavy.

You say:

> “A bet on AI infrastructure, not AI molecules.”

Good.

However, I would elevate this.

This is probably one of the most strategically important categories.

Why?

Because the future bottleneck may not be model availability.

It may be:

- deployment
- governance
- data access
- workflow integration

Your tracker currently underweights this.

---

6. Perceptic

This one worries me.

The description:

> “Palantir playbook applied to pharma”

is catchy but promotional.

The question a pharma strategy person asks:

“What workflow does this replace?”

You need specifics:

- clinical operations?
- R&D portfolio decisions?
- regulatory?
- manufacturing?

Otherwise it becomes “AI operating system” language.

---

7. AstraZeneca × Modella AI

The acquisition appears real and undisclosed financially. cb citybiz +1

But:

> “first outright acquisition of an AI firm by a major pharma company”

I would soften.

Safer:

> “one of the first major examples of big pharma acquiring an AI-native life sciences company rather than licensing the technology.”

The current wording invites correction.

---

8. Lilly × NVIDIA

Strong.

This is one of your best entries.

The deal is genuinely strategic:

- AI infrastructure
- research environment
- drug discovery
- robotics/physical AI

NVIDIA Newsr... +1

But your headline:

> “pharma’s most powerful AI supercomputer”

is too promotional.

Use:

> “one of pharma’s largest dedicated AI infrastructure investments.”

---

9. Insilico × Lilly

Good.

But missing nuance:

Insilico is important because it is one of the few AI biotech companies with:

- internally generated pipeline
- wet lab validation
- clinical-stage programs

The story is not “AI designed molecules”.

The story:

> “Can an AI-native biotech become a new drug company archetype?”

10–19: Broad feedback

The later entries become noticeably more speculative.

Examples:

OpenAI × Novo Nordisk

Be careful.

This category is different.

A GPT enterprise deployment is not equivalent to AI drug discovery.

You are mixing:

- scientific AI
- enterprise productivity AI

They should probably have different tags.

Anthropic × BMS

Same issue.

This is enterprise transformation, not pharma AI discovery.

It belongs in:

Enterprise AI

but not alongside molecular AI deals without stronger separation.

Edison / Owkin AI Scientist

Interesting but currently hype-heavy.

The key question:

“Does the AI agent produce validated scientific hypotheses faster than scientists?”

Your analysis assumes yes.

A stronger tracker would add:

Evidence level

Example:

- Commercial deployment
- Pilot
- Research collaboration
- Pipeline asset
- Clinical validation

Missing important deals

I would add:

1. Roche × Recursion

Very important.

Why:

- One of the biggest AI drug discovery partnerships historically
- Combination of Roche's biology + Recursion's automated biology platform

Strategic lesson:

> AI drug discovery is increasingly about proprietary biological data generation, not just models.

---

2. Novartis × Isomorphic Labs

You mention it indirectly but should have a standalone entry.

Important because:

Novartis is one of the most aggressive AI pharma adopters.

---

3. Sanofi × Owkin

Major AI oncology / precision medicine relationship.

Important because it represents:

AI + real-world data + patient stratification.

---

4. Bayer × Recursion

Worth including.

Shows pharma moving from licensing AI tools toward shared platforms.

---

5. Moderna × OpenAI

If covering enterprise AI, include it.

The distinction matters:

- AI as scientist
- AI as employee

Taxonomy critique

Your five categories are good but incomplete.

Current:

- Drug Discovery
- Clinical Development
- Manufacturing
- Enterprise
- Compute

I would change to:

1. Biology & Molecule Creation

(target discovery, protein engineering, chemistry)

2. Clinical Intelligence

(biomarkers, trial design, patient selection)

3. Development & Operations

(manufacturing, regulatory, supply chain)

4. Enterprise AI

(corporate workflows, knowledge workers)

5. AI Infrastructure

(models, compute, data platforms)

Why?

Because “Drug Discovery” is too broad.

A protein engineering deal and an AlphaFold-like model are fundamentally different.

Product & UX Review

What works

The basic interaction model is good:

- category filters
- expandable cards
- search
- contribution workflow

The tracker is already better than a spreadsheet.

Biggest UX issue

The collapsed card gives too little context.

Right now:

Company × AI company
Deal type
Value
Summary

For a strategist, the missing fields are:

Add:

Strategic thesis

Example:

“Why pharma cares”

One sentence.

Add:

AI maturity

Example:

🟢 Production deployment
🟡 Pilot
🔵 Research collaboration
⚪ Funding only

Huge improvement.

Add:

Deal archetype

Examples:

- Acquire capability
- License platform
- Access compute
- Build internal AI workforce
- Source pipeline assets

This is much more valuable than “partnership”.

Community suggestion workflow

Good idea.

Failure modes:

1. Garbage submissions

Need:

- source required
- URL required
- announcement date required

---

2. Duplicate deals

Need fuzzy matching:

Sanofi + AI company

should warn:

“Possible existing deal.”

---

3. Bias toward famous companies

Community will over-submit:

- OpenAI
- NVIDIA
- Google

while missing:

- biotech AI startups

Need editorial weighting.

What feature would make this genuinely useful?

The biggest missing feature:

Deal intelligence layer

Not just:

“What happened?”

But:

“What pattern is emerging?”

Example dashboard:

Pharma AI strategy map

Company | Strategy

Lilly:

- build infrastructure
- external models
- internal AI factory

AstraZeneca:

- oncology AI
- acquisition strategy

Sanofi:

- AI biotech partnerships

This is where it becomes thought leadership.

Strategic Positioning

Current state

You are halfway there.

It does not feel like “anyone could make this” because:

- the selection is thoughtful
- the writing has thesis elements
- the categories show domain knowledge

But today it is still mostly:

Curated database + commentary

To become an industry resource:

Add editorial layers.

Every month publish:

“AI × Pharma Deal Intelligence Report”

Sections:

1. Biggest deals
2. Emerging patterns
3. Companies increasing/decreasing AI activity
4. What VCs are funding
5. Strategic implications

Editorial voice

The strongest entries are:

- Earendil
- NVIDIA/Lilly
- CytoReason
- Cradle

Weakest:

- generic enterprise AI entries

Why?

Because your strongest voice comes from your PhD background:

biology + pharma strategy.

When you discuss Claude/OpenAI deployments, you sound like a technology analyst.

When you discuss protein engineering and drug discovery, you sound differentiated.

Lean into that.

What I would build next (priority order)

1. Add evidence grading

Every deal:

Evidence:

- Announced
- Commercial
- Clinical
- Pipeline
- Revenue-generating

This instantly increases credibility.

---

2. Add “Strategic thesis” field

Not:

“Why this deal matters”

Instead:

“What strategic shift does this represent?”

---

3. Build pharma AI strategy profiles

Example:

“Eli Lilly’s AI strategy”

with all deals grouped.

This is where BD teams would bookmark it.

---

4. Add timeline view

The story is changing fast.

A timeline showing:

2023 → partnerships
2024 → platforms
2025 → infrastructure
2026 → AI-native operating models

would be powerful.

Final assessment

My rating:

Content quality: 7/10
Good curation, but too many claims need tighter evidence discipline.

UX: 7.5/10
Clean and usable, but needs intelligence layers.

Strategic positioning: 6.5/10 today
The foundation is strong, but it becomes differentiated only when you move from “tracking deals” → “explaining the strategic evolution of pharma AI.”

The opportunity is not to build the Bloomberg terminal of AI pharma deals.

The opportunity is to become the person who explains **why pharma is making these bets and what they reveal about the future operating model of drug development.**
