AI × Pharma Deal Tracker — Project Context

What this is

A React-based interactive tracker that maps how big pharma is embedding AI across the drug development lifecycle. It lives as a component on my personal website (suruchisethi6.github.io) and is designed to be a living, community-contributed resource.

The tracker grew out of a LinkedIn post I wrote tracking AI × pharma deals in H1 2026, which got strong engagement. The idea is to turn that one-off post into a persistent, filterable, expandable tool.

Current state

The tracker is a single `.jsx` file (React component) with the following features:

19 deals currently tracked:

1. Sanofi × Earendil Labs — up to $2.56B, AI-driven bispecific antibody discovery (Jan 2026)
2. Eli Lilly × Isomorphic Labs — DeepMind spinout co-development partnership ($2.1B raised, 2025)
3. J&J / AbbVie / Novo Nordisk / Bayer × Cradle — protein engineering platform, 50+ programmes (2025–2026)
4. GSK × NOETIK — spatial biology foundation models for oncology ($50M upfront, Jan 2025)
5. Eli Lilly × Tamarind Bio — AI model inference infrastructure (2025)
6. CSL + others × Perceptic — enterprise OS from ex-Palantir founders ($12M seed, May 2026)
7. AstraZeneca × Modella AI — first AI acquisition by big pharma (Jan 2026)
8. Eli Lilly × NVIDIA — $1B AI Factory supercomputer (Jan 2026)
9. Eli Lilly × Insilico Medicine — $115M upfront, up to $2.75B licensing (Mar 2026)
10. Merck × Google Cloud — up to $1B enterprise agentic AI across 75,000 employees (Apr 2026)
11. Novo Nordisk × OpenAI — discovery, manufacturing & supply chain partnership (Apr 2026)
12. Daiichi Sankyo × Imagene AI — multimodal biomarker discovery in oncology (Apr 2026)
13. AstraZeneca × OWKIN — 3-year AI Scientist platform licensing (May 2026)
14. Bristol Myers Squibb × Anthropic — Claude across 30,000+ employees (May 2026)

15. Incyte × Edison Scientific — Kosmos AI scientist platform (May 2026)
16. Sanofi × CytoReason — third extension of AI disease simulation partnership (2026)
17. Pfizer × Chai Discovery — Chai-3 model licensing + custom model (Jun 2026)
18. Pfizer × Boltz Bio — multi-year collaboration, foundation models on Pfizer data (Jan 2026)
19. Merck × Protillion Biosciences — up to $510M, Prot-MaP protein design platform (Jun 2026)

Category system (replaced the original drug development pipeline):

Instead of mapping deals to pipeline stages (Target ID → Hit Discovery → Lead Opt → etc.), we use 5 categories that reflect where AI actually creates value in pharma:

- **Drug Discovery** — target ID, molecule design, protein engineering, generative chemistry
- **Clinical Development** — biomarkers, trial design, patient stratification, response prediction
- **Manufacturing & Supply Chain** — production optimisation, supply chain AI
- **Enterprise Operations** — cross-functional AI platforms deployed company-wide
- **Compute & Infrastructure** — AI supercomputers, model hosting, inference infrastructure

Features:

- **Filterable category bar** — click any category to filter deals by where AI creates value
- **Search** — filter by company name, partner, deal type, or keywords
- **Expandable deal cards** — collapsed view shows summary; expanded shows "About the AI partner" and "Why this deal matters" analysis
- **Community suggestions** — "Suggest a deal" button lets visitors submit deals for review
- **Admin approval workflow** — click "Suruchi Sethi, PhD" in footer → enter passphrase `suruchi2026` → unlocks admin mode with:
  - "+ Add deal" button (direct add, skips review)
  - "Review" button (approve/reject community submissions, turns amber when pending)
  - "Remove" button on each deal card
  - "Reset data" option in footer
- **Persistent storage** — deals and pending submissions persist across sessions using the artifact storage API

Design:

- Dark header (gradient `#0f172a` → `#1e293b`) with cyan (`#22d3ee`) accent
- White deal cards with coloured deal-type badges
- Teal (`#0891b2`) as primary interactive colour
- Stats bar: deals tracked, pharma companies, AI partners, total deal value ($12B+)
- Clean, professional look consistent with the main website's design language

My website

The main site is a single `index.html` file hosted on GitHub Pages at suruchisethi6.github.io. It includes:

- Hero section with my positioning as a PhD biochemist / CI consultant
- About section explaining my background (Max Planck PhD, IIT Delhi, Eradigm Consulting)
- Insights section linking to my LinkedIn posts on AI in pharma
- Projects section (currently a placeholder — the deal tracker should go here)
- Experience timeline
- Contact section with Calendly, LinkedIn, and email

Design uses DM Serif Display + DM Sans fonts, teal (`#0d9488`) accent colour, dark navy (`#0c1e2e`) header.

What still needs to happen

- **Deploy the tracker to the live site** — integrate the React component into the GitHub Pages site (may need a build step or could embed as a standalone page)
- **Link it from the Projects section** — replace the "work in progress" placeholder
- **Consider**: should it be embedded on the main page or a separate /tracker page?
- **Consider**: the persistent storage API works in Claude artifacts but would need a different storage solution (e.g. localStorage, Supabase, or a JSON file) for the live deployed version

About me

Suruchi Sethi, PhD. Life sciences consultant at Eradigm Consulting in London. Background in biochemistry (PhD Max Planck Institute), competitive intelligence, and strategy across oncology, neurology, immunology, and rare diseases. Writing publicly about AI in drug discovery and pharma competitive dynamics on LinkedIn. Non-coder building with AI tools.
